By examining neural correlates of emotional response, she contributes to identifying biomarkers that can inform diagnosis and treatment planning.

Emotion Regulation and Trauma

One of Mariann Weierich's key research areas involves studying the mechanisms underlying emotion regulation difficulties in trauma survivors. She explores how specific brain regions, such as the amygdala and prefrontal cortex, interact during emotional processing and how these interactions differ in clinical populations. This research helps clarify why some individuals develop chronic symptoms after trauma while others show resilience.

Neuropsychological Assessments

In addition to neuroimaging studies, Mariann Weierich employs neuropsychological assessments to evaluate cognitive functions related to attention, memory, and executive functioning in her research participants. These assessments help link behavioral outcomes with neural activity, providing a more holistic understanding of psychological disorders.

Notable Publications and Studies

Mariann Weierich has authored and co-authored numerous peer-reviewed articles, book chapters, and conference presentations. Her publications often

focus on the neural mechanisms of emotion regulation, the psychological impact of trauma, and the integration of neuroscience in clinical practice. These works have been widely cited and have contributed to advancing the field's knowledge base.

Key Research Articles

Several of Mariann Weierich's articles have been influential in shaping current perspectives on trauma and emotional health. Her studies on amygdala reactivity in PTSD patients, for instance, provide critical insights into the neural basis of hypervigilance and emotional dysregulation. Other research explores the effectiveness of various therapeutic interventions in normalizing brain function.
