Understanding Drafting Views in Revit

Drafting views in Revit are non-model-based views used to create 2D details, annotations, or other graphic information that do not rely on the 3D model. These views are essential for documenting specific construction details, standard notes, or symbols that apply across different projects. Unlike plan, elevation, or section views, drafting views are independent and often reused to maintain consistency in documentation.

Because drafting views contain important annotation elements and detail components, copying them accurately to another project requires careful handling. The ability to transfer drafting views supports efficient reuse of detail work, reducing the need to recreate similar content from scratch in new projects.

Methods to Copy Drafting Views to Another Project

There are multiple approaches to copy drafting views from one Revit project to another, each with its advantages depending on the project setup and requirements. The most commonly used methods include:

1. Exporting and importing drafting views through DWG files.

2. Using Transfer Project Standards to bring drafting views and associated settings.
3. Copying drafting views via templates or linked models.

Each of these methods will be explained in detail to enable users to choose the best approach for their workflow.

Exporting and Importing Drafting Views via DWG

One straightforward way to transfer drafting views is exporting them as DWG files and then importing or linking these DWG files into the target project. This method is helpful when direct copying is not possible due to project restrictions or software versions.

Steps include:

- Open the drafting view in the source project.
- Export the view to DWG format using the Export CAD feature.
- Open the target project and import or link the DWG file into a new drafting view.

However, this method converts native Revit elements into CAD geometry, losing parametric and editable features.

Copying Drafting Views Using Transfer Project Standards

Revit's Transfer Project Standards tool allows users to copy drafting views, along with styles, object styles, and other standards, from one project to another. This method preserves the Revit-native elements and maintains full editability.

To perform this:

- Open the target Revit project.
- Go to the Manage tab and select Transfer Project Standards.
- Choose the source project file and select the drafting views and related standards to transfer.
- Confirm the transfer to import the drafting views into the active project.

This technique is highly recommended for maintaining consistency and Revit data integrity.

Using Transfer Project Standards for Drafting Views

The Transfer Project Standards tool is a powerful feature for copying drafting views between

projects while retaining all annotations, line styles, and detail components. It is designed to transfer various project elements including view templates, object styles, and drafting views.

When using this feature, it is important to note the following:

- Both projects must be accessible and compatible with the same Revit version.
- Conflicts in styles or naming conventions may arise and require user confirmation to override.
- Drafting views are transferred as part of the project standards, not as independent files.

This method ensures that drafting views retain their original appearance and editing capabilities within the new project.

Step-by-Step Transfer of Drafting Views

To efficiently transfer drafting views using this method, follow these steps:

1. Open the destination Revit project where the drafting views will be copied.
2. Navigate to the Manage tab and select *Transfer Project Standards*.
3. Browse and select the source project file containing the drafting views.
4. In the dialog box, choose the categories such as Drafting Views, Object Styles, and View Templates.
5. Review any warnings about conflicts and decide whether to overwrite the destination standards.
6. Complete the transfer and verify that the drafting views appear correctly in the project browser.

Leveraging Templates and Linked Models

Another effective way to reuse drafting views is through the use of project templates or linked models. Templates can include preloaded drafting views, which will be available in any new project created from the template. Similarly, linking models can help display drafting views indirectly.

Using templates involves:

- Creating or modifying a Revit template file (.rte) to include the desired drafting views.
- Saving the template for use in future projects.
- Starting new projects based on this template to automatically inherit drafting views.

Linked models provide a way to reference drafting views without copying them permanently into the project but may limit editing capabilities.

Creating and Using Drafting View Templates

Templates ensure standardization and facilitate quick project setup. To create a drafting view template:

1. Open a project and create or modify drafting views as needed.
2. Save the project as a template (.rte) file.
3. When starting a new project, select this template to have the drafting views preloaded.

This method is ideal for firms requiring consistent drafting details across multiple projects.

Best Practices for Managing Drafting Views Across Projects

Efficient management of drafting views across multiple Revit projects requires adherence to best practices that promote consistency and reduce errors. Key recommendations include:

- Maintain a centralized library of standard drafting views and details.
- Use templates to standardize drafting content and styles.
- Regularly update and audit drafting views to ensure accuracy and relevance.
- Ensure consistent naming conventions for ease of identification and transfer.
- Utilize Transfer Project Standards to minimize manual recreation of views.
- Document and train team members on procedures for copying and managing drafting views.

Implementing these practices can greatly improve productivity and quality control in project documentation workflows.

Common Challenges and Troubleshooting Tips

Copying drafting views between Revit projects can sometimes encounter issues related to compatibility, missing styles, or conflicts. Understanding common challenges helps in troubleshooting effectively.

Some typical problems include:

- Drafting views not appearing after transfer due to view filters or templates.
- Loss of annotation styles or line weights when exporting to CAD formats.
- Conflicts in object styles or shared parameters causing warning messages.
- Drafting view elements linked to model components that do not exist in the target project.

To resolve these issues, it is advisable to:

- Verify that all relevant styles and standards are included in the transfer.
- Check the visibility and graphics settings in the target project.
- Use consistent Revit versions and file formats.
- Consult Revit warnings and resolve conflicts during Transfer Project Standards operation.

Frequently Asked Questions

Can I copy a drafting view from one Revit project to another?

Yes, you can copy a drafting view from one Revit project to another by using the Transfer Project Standards tool or by creating a drafting view template and applying it in the target project.

What is the easiest method to copy a drafting view between Revit projects?

The easiest method is to open both projects and use the 'Transfer Project Standards' feature to transfer drafting views and their associated settings from the source project to the destination project.

Does copying a drafting view to another Revit project also transfer the view's detail components?

Yes, when you transfer drafting views using Transfer Project Standards, the detail components and annotations within that view are copied to the target project.

Are there limitations when copying drafting views between Revit projects?

Yes, certain elements like linked files, custom families, or view-specific settings may not transfer perfectly and might require manual adjustments after copying.

Can I use Revit templates to replicate drafting views in another project?

While Revit templates can contain drafting views, they typically do not transfer existing drafting views directly. It's better to use Transfer Project Standards or manually recreate the view.

How do I transfer only specific drafting views without bringing over all project standards?

Revit's Transfer Project Standards tool does not allow selective transfer of individual views. You may need to copy and paste drafting view contents manually or use third-party tools for selective transfer.

Is it possible to copy drafting views with their linked annotations intact?

Yes, transferring drafting views via Transfer Project Standards usually includes linked annotations, but it's recommended to verify all annotations post-transfer.

What steps should I follow to transfer drafting views using Transfer Project Standards?

Open both source and destination projects, go to the Manage tab, select Transfer Project Standards, choose the source project, then select the drafting views and related standards to transfer, and confirm.

Are there any third-party plugins that simplify copying drafting views between Revit projects?
